A ready-to-install bathroom module for new constructions or renovations

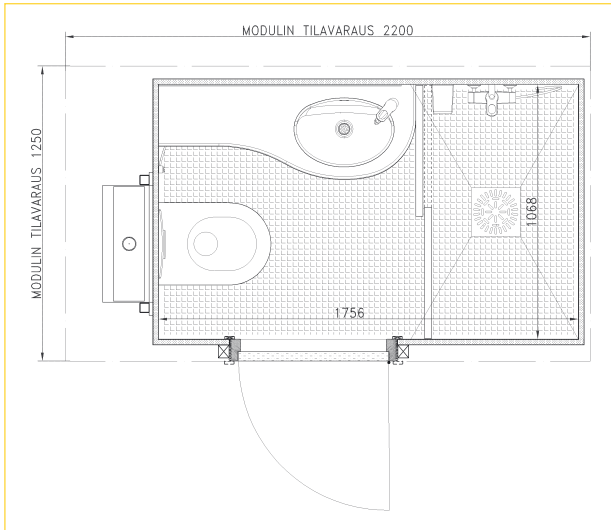

The JMK188 bathroom module by Joptek Composites is the perfect solution to building wet spaces easily and quickly. The bathroom contains a toilet, wash basin and shower.

As well as saving room and being light and hygienic, lightweight building systems have the further great advantage of being quick and easy to install.

The structural solution

The JMK188 bathroom module is a modern-technology factory product based on the use of composite structures. The module comes ready with electrical, plumbing and HVAC connections tested in our factory.

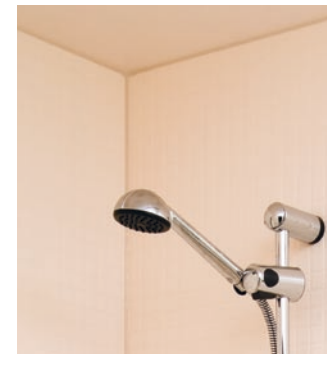

Lightness and firmness

Lightweight building systems are considerably lighter than conventional construction solutions. The JMK module weighs 300 kg.

A bathroom module made of lightweight building systems does not require reinforcement of the building's structures, and its location can be freely chosen. This makes it especially suitable for redevelopment and renovation sites.

Watertight element structure

The bathroom structures have been designed to be watertight. This means that the floor structure does not require protection from water damage and that moisture will not penetrate seams in the wall tiling and cause damage.

Easy to keep clean

The bathroom module has been designed to be seamless, making it much easier to keep clean than conventional bathrooms. Because of their seamless and rounded design, even the corners are quick and effortless to swipe clean and easy to keep free from dirt and bacteria. The module takes into account considerations of hygiene, essential in hotel, hospital, and housing construction.

Selection of surface materials

Our bathroom model JMK188 is coated with laminate patterned to appear like tiling. You can select the colour of the laminate from our colour map. The outer surface of the module will be finished at the site. Feel free to ask about our other options if these are not the most appropriate materials for your site.

References

We have delivered light-weight bathroom modules to many destinations. You can find our wet spaces for instance in the Runni health spa, in the apartments of Finnish student-housing agencies LOAS and TKY, in Omena hotels and in great luxury cruisers.
